STRUCTURAL / DEVELOPMENT AND CONSTRUCTION

Perth, Western Australia

ADG has provided full structural engineering designed modelling from foundation through to vertical and horizontal and roof structure. The structure will be a combination of concrete frame, masonry and precast.

ADG provided an efficient solution to the superstructure which enabled flexibility to be achieved in variable ground conditions.

Challenged with architectural variances in structure and site conditions, ADG have been able to maintain a simplified building frame through a detailed understanding of the building and its behaviour.

ADG has developed a strong relationship with the contractor, Pindan, over a number of projects and will continue to build mutual success through collaborative design and construction.
